*« (...) the mythical and symbolic journey from a square to a circle in sacred buildings creates geometrical transitional patterns, which was fundamental to the root of my bachelor project.»*

Tomb's of the Sufi Mystic Abd al-Samad Isfahani (1308 A.C), Isfahan, Iran

Analyzing and constructing the pattern of the tomb for a plaster-mold

In this project I studied structures of the monumental buildings in ancient Iran, which brought me to the origins of geometrical discoveries and developments in religious architectural design expressions.

For this project specifically I analyzed the internal structure of the tomb of Sufi Mystic Abd al-Samad Isfahani (1308), which features many engineering and structural innovations in ancient geometric design. The structural form rising from an octagonal base within cruciform system evokes a sense of immeasurable spirituality, profiting from the interplay of lights and shades created by the geometrical textures of the tomb roof.

The dance from square to circle that takes place in the aforementioned roof - and is reflected in my work - highlights

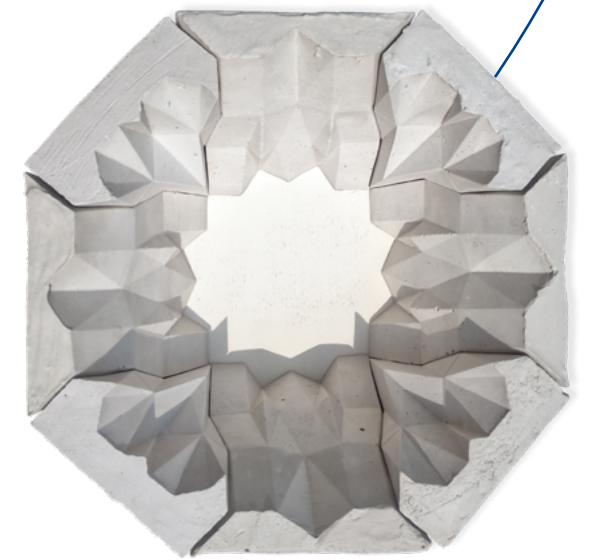

the sensual aspects of the liminal space, the transition, the symbolic inbetween.

The precision of these structures required adequate and practical modelling techniques. To achieve this I used digital drawings to analyze the form of the tomb roof. On the basis of these observations I created a form, which I built using a cutting plotter machine. Afterwards, I used various modelling techniques to develop a production cycle that protects the precision of the work.

The cultural and structural diversity of this work was fundamental to the development of my bachelor project, which uses the modularity of geometrical patterns to generate expandable spatial structures.

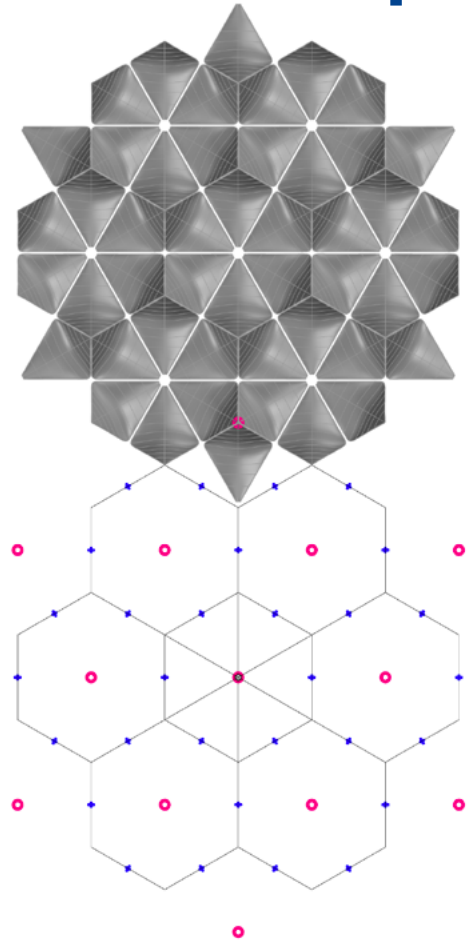

Endproduct casted in Porcelan (Bowl)  
L 23 x W 23 x H 10.5 cm

# serendipity

2020

Serendipity is a pavilion designed for small open-air music festivals. The sculptural construction creates an atmosphere that initiates a connection between antique architectural approaches and contemporary musical gatherings. The patterns of the roof are intricately reflected on the ground, like the sun creates shadows, and this becomes an invitation to connect with the space emotionally. The modular design enables the product to quickly assembled, dismantled and packaged by the user, and effectively transported. The structure's geometrical design gives a pattern that can be continuously enhanced and refined.

2014—2020

*« (...) an attempt to conceptualize an abstract reaction to manipulate facial recognition.»*

## Method

During two years of face anatomy studies in various sculptural projects, I conceptualized the possibilities of a harmonic design in sunglasses. The main objective was to achieve an expressive shape that dissolves and emphasizes specific facial characteristics using the form of the human skull. Each frame is designed for a certain person, studying features of their face.

Facial recognition is a delicate topic, deeply connected to our contemporary epoch. This project aims to conceptualize an abstract reaction and manipulate this phenomenon.

## Process

The first phase of design analyses the structure of a specific face by drawing and sculpting in order to create a portrait the subject. The second phase realizes the tangible form through various two-dimensional frames designed following the preliminary designs. The final step is to create a form within the developed frame, connecting it to the shapes of the face.

Different attitudes within traditional handcraft methods such as fast modelling, steam bending and sculpting were used, as well as digital fabrication techniques like 3D sketches and printing to develop the products.

A collaboration between:

This project is one of the many proposed and executed designs for the light factory «Mawa» in Berlin. The basic model of the design is inspired from both agricultural ancient and modernized silos. On one hand, using the traditional glass production methods for component A (detailed above) brings out the ancient like feelings of the form and material. On the other hand, components B & C is produced using digital fabrication techniques to mould the ceramic and implementing technical parts of the light.

« (...) inspired from both agricultural, ancient & modernized silos.»

The exchanges with different production offices were a great experience. Working with professional technicians and discussing solutions for the production brought up a lot of new ways to approach design. These conversations questioned the reality of design and the importance of the technical aspects of production. The design process took 4 months and is being developed and produced by «MAWA» under supervision of HAW Design Atelier.

# stool 155

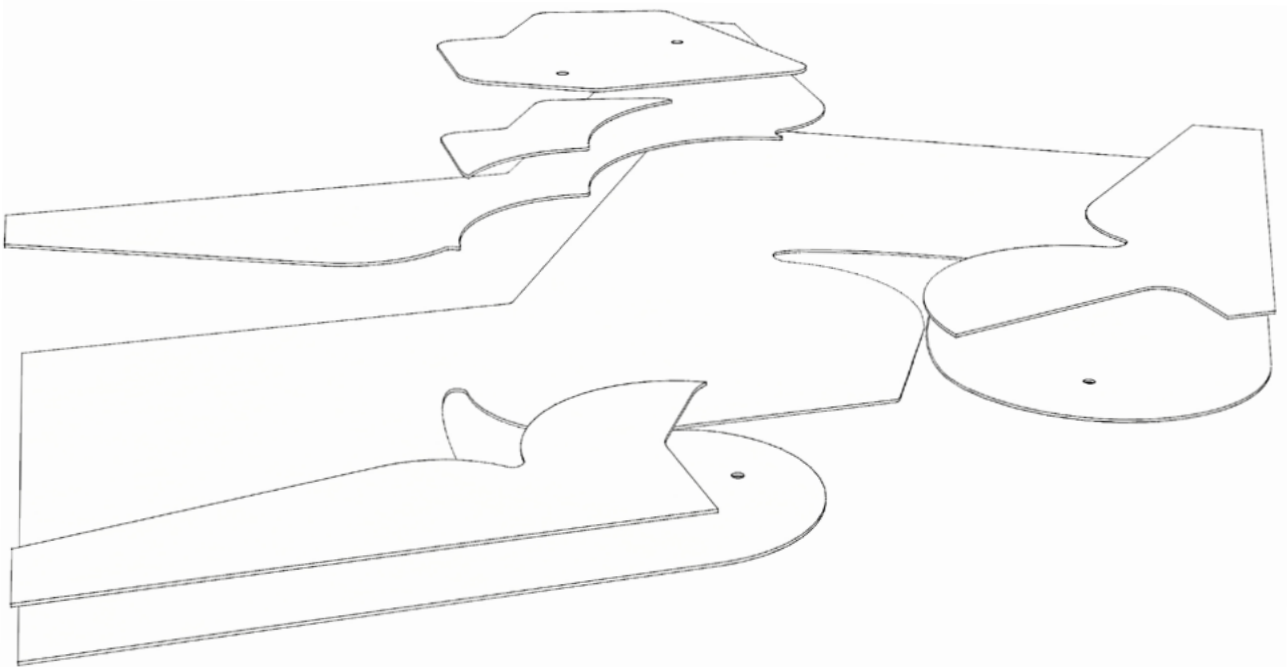

2018

Despite modern techniques, products are not always considered as purely industrial artifacts. Instead, they are frequently an expression of socio-philosophical concepts and, with that, are representative of their zeitgeist. Following from that idea, *this project searches for forms that go beyond purely material and production technology.* This guiding principle, especially the use and meaning of the symbols, have been made the focus of the creative process. *The interaction between form and material develops via numerous attempts that are made on different scales.* Due to the material properties of cardboard, the initial tests and first development of the forms were carried out in this material. The design developed is then worked out precisely in their form by using a milling machine. A model is created using a scale of both 1:3 and 1:5, made of aircraft plywood, after which it is examined for the results pertaining to its strengths and weaknesses. Weak points were then strengthened in the final design and fixed with screws. The form of the stool is not created by using a press mould. Instead, it is the result of an

bottom view - the puzzlelike assemblage

active deformation process of the wet plywood. *This led to the creation of an abstract form that can be used as seating furniture, both in the home area and in public institutions, such as galleries or museums.* The basic concept of the form is designed to promote a dialog between cultural, social and historical contexts referring to antique perception of conceptual conversion from square to circle, emphasizing on geometrical transition techniques.
